

MonoBehaviour

```
classDiagram
    class MonoBehaviour
    class PauseManager {
        +static bool IsPaused
        -GameObject pauseMenu
        -static GameObject pauseMenuPrefab
        +static void Pause()
        +static void Resume()
        +static void ResumeTime()
        -void Awake()
    }
    PauseManager --|> MonoBehaviour
```

The diagram illustrates a class hierarchy where `PauseManager` inherits from `MonoBehaviour`. `MonoBehaviour` is represented by a box with three horizontal compartments, with the name in the top one. `PauseManager` is a larger box with a grey background, divided into three horizontal sections. The top section contains the class name. The middle section lists attributes: a static boolean `IsPaused`, and two static `GameObject` references, `pauseMenu` and `pauseMenuPrefab`. The bottom section lists methods: three static void methods (`Pause()`, `Resume()`, `ResumeTime()`) and one instance void method (`Awake()`). A blue arrow with an open triangular head points from the `PauseManager` box up to the `MonoBehaviour` box, indicating inheritance.

PauseManager

- + static bool IsPaused
- GameObject pauseMenu
- static GameObject pauseMenuPrefab
- + static void Pause()
- + static void Resume()
- + static void ResumeTime()
- void Awake()
